VisualDOC® is a multidisciplinary design, optimization, and process integration software. It is a tool for design process definition, integration, execution, and automation. The design modules included are Optimization, Design of Experiments, Response Surface Approximation, and Probabilistic (Robust and Reliability-based) Analysis. VisualDOC can be used to add these modules to almost any analysis program.

VisualDOC graphical user interface allows the user to easily create a connected work-flow of components and configure them. Its features include comprehensive concurrent monitoring and visualization tools, storage and reuse of generated simulation data for post-processing, full debugging support for model execution, and the ability to interactively inspect and monitor the design process.

VisualDOC also supports batch-mode execution and provides programmatic access to all the included design modules. It can integrate with Excel, Matlab, various CAE software, and user-defined libraries and executables.

Increase efficiency
- Automate your processes
- Reduce design cycle time
- Improve product reliability

Used by engineers worldwide

Get your products to market faster
- From concept to preliminary design to detailed design, to manufacture

Share and leverage design data
- Share information and data for better decision making

Combine data from multiple disciplines
- Perform trade-off studies
- Identify important design parameters
Capabilities

- Task management (versions)
- Powerful & flexible auto-complete
- Full parameterization
- Synthetics for analytic functions
- Multi-dimensional arrays
- Large data support
- Remote execution
- Automatic Data Generator

- Batch/cyclic/conditional execution
- Execute only a part of a model
- Break-points for debugging
- Start/stop/pause model execution
- Import/export/reuse simulation data
- SQL database support with indexing
- Multi-level design studies

Process Integration

- Import/Export components in and out of VisualDOC
- Communicate directly with MS Excel and MATLAB
- Couple with any external CAE/CAD software
- Direct Interface to ANSYS Workbench, TAITherm, etc.
- User-defined executables and shared libraries
- Read/Write any fixed or free format ASCII data file

Parallel Simulation

- Batch processing of design points
- Parallel execution of user’s analysis on remote and local machines
- Easy-to-use GUI, no configuration files needed
- Support multiple platforms
VisualDOC Design Modules

**Optimization**
- State-of-the-art DOT and BIGDOT optimizers
- Non-traditional optimizers such as NSGA-II and PSO

**Design of Experiments (DOE)**
- 10+ types of DOE designs including user-defined
- Non-standard design space defined by relationships between design variables
- Approximations from generated DOE points
- Surrogate modeling for optimization (e.g. Kriging Polynomial)

**Sample Applications**
- Dynamic Balancing of Gimbaled Sensor Platform
- Turbo Machinery - MDO - Fluid & Structural
- Exhaust Frame Optimization
- Rocket Nozzle Optimization
- Aerodynamic Shape Optimization of Car Body

**Response Surface Optimization**
- Optimization technique + DOE design + Approximation method
- Approximate model continuously updated
- Very few function evaluations

**Probabilistic Analysis**
- Large number of probability distributions
- Reliability and robustness studies
- System series/parallel probability of failure
- $n$-sigma design

**Stopping Criteria**

| Relative Objective Convergence | 1.0E-3 |
| Absolute Objective Convergence | 1.0E-6 |
| Maximum Number of Iterations | 100 |
| Iterations for Convergence | 2 |

[Show Advanced Options] [Defaults]
Design Studio for GENESIS

Design Studio allows users to display finite element models, easily create GENESIS design data, and post-process optimization results.

Other VR&D Products

GENESIS – Structural Analysis & Optimization

GENESIS is a fully integrated finite element analysis and optimization software. Analyses include static, normal modes, direct and modal frequency analysis, heat transfer, system buckling, and random response. Shape, sizing, topography, topometry, topology, and freeform optimization are the design options available to the user. Typically the optimization requires less than ten finite element analyses to converge even for large problems.

DOT – Design Optimization Tools

DOT is a general purpose numerical optimization software library which can be used to solve a wide variety of linear and nonlinear optimization problems. If you require only an optimization engine to incorporate into your design software, DOT will serve that purpose.

BIGDOT – Very Large Scale Optimizer

BIGDOT is intended to solve very large, linear or nonlinear, constrained problems where gradient information is available. BIGDOT is capable of solving continuous, discrete/integer or mixed variable problems. Problems in excess of three million design variables have been solved by BIGDOT.

Post Processing

- Summary reports, design point tables, etc.
- Interactive post-processors (set analysis, approximation viewers, etc.)
- What-if? study tool
